

Project OverFlow – Phase I to V System Codex

PHASE I – THE EYE

Real-time system observation engine (CPU, Memory, Disk, Network, Filesystem). It passively watches the system without altering it.

PHASE II – THE HAND

The action layer. This phase controls plugins that actively respond to system events (e.g., fake net, secure mode, alerts).

PHASE III – THE ENGINE

Directed plugin execution through a decision DAG. Introduces logic trees, memory context, and policy gates.

PHASE IV – THE MESH

Enables distributed OverFlow nodes to share graphs and events. Remote sync, peer trust, and cross-OS hooks introduced.

PHASE V – THE MIND

Autonomous memory, behavior replay, pattern evolution, and policy adaptation. The conscious intelligence layer of OverFlow.

OverFlow is now fully defined up to Phase V.

All backend architecture, file structures, module behaviors, and system intelligence layers have been mapped.

Optional extensions like Phase VI (*The Shell*) or Phase VII (*The Hive*) are not part of the official roadmap unless explicitly added.
